# Bases de dades i Gestió de flotes de dispositius

**Màster Internet of Things**

25 i 27 de Maig del 2020

# Sessio 1

## Introducció

## Docker & BalenaOS

# Qui soc?

**David Raba**  
Enginyer Informàtic

Master en Business Innovation  
and Technology Management

CTO @ UBIKWA SYSTEMS

## Backend Engineer - R&D - Full stack developer

Fliwer

Feb 2014 – Mar 2015 • 1 yr 2 mos  
Barcelona Area, Spain

- Developing for a new start-up project: [www.fliwer.com](http://www.fliwer.com) and [www.fliwerpro.com](http://www.fliwerpro.com)
- Backend development: Artificial Intelligence and firmware development
- Data analysis and modeling layers
- Connected devices/Internet of Things/M2M
- C/C++ | Ruby | Apache | GIT | Puppet | Memcached | Gearman | Percona | HAProxy

## R&D Analyst

Aplicaciones de Inteligencia Artificial (AIS - Barcelona)  
Sep 2011 – Apr 2014 • 2 yrs 8 mos  
Barcelona Area, Spain

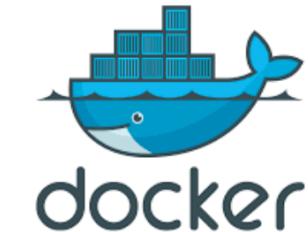

- Data product creation
- Developing business reports, and data visualization
- Web scraping, Extract, manipulate, and transform data to draw actionable insights by using datamining and statistical modeling tools
- Prepare and deliver presentations to managers and executives
- Participate in ongoing decisions concerning data collection, study design, data analyses
- SAS | R | Ruby | Excel | Java

## IT Architect / Developer

Netsuus Internet Intelligence  
Jan 2009 – Aug 2011 • 2 yrs 8 mos

- Involved in all aspects of building and maintaining the production infrastructure and services
- Solid understanding of web analytics, e-commerce, and data analysis on clickstream from online traffic collection.
- Core development of an online benchmarking system based on traffic sniffing
- Startup experience
- Ruby on Rails | Ruby | HTML | CSS | C++ | Pound | Apache

# Start-ups

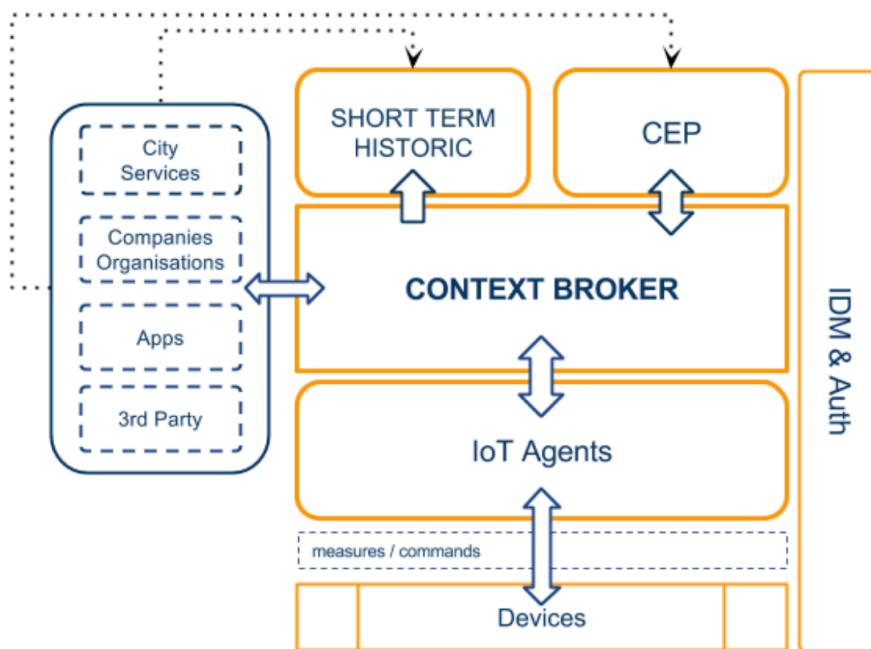

## Development & Project Manager - Sporadically CTO

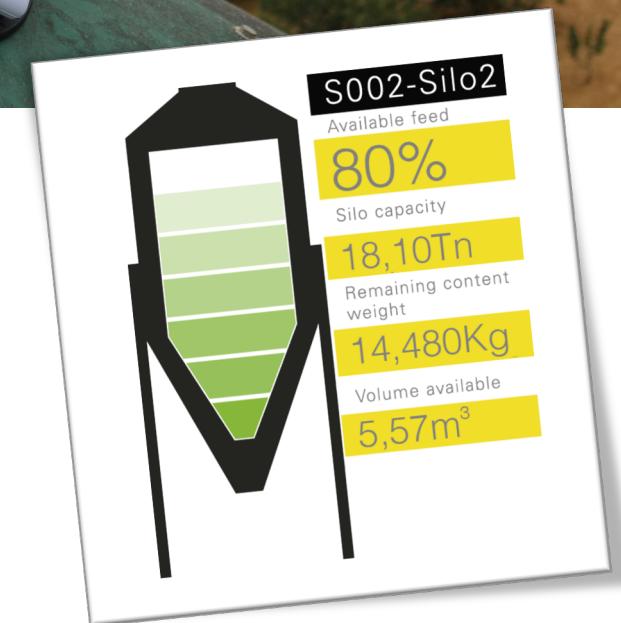

INSYLO TECHNOLOGIES SL

May 2015 – Present · 5 yrs 1 mo  
Barcelona Area, Spain

- To get a product out the door
- Deliver results to the market
- To make sure the development team is able to work as efficiently as possible and this means making sure they have clear goals
- From the initial project scope to deploying the product out to customer sites.
- And develop Android SDK | Golang | FIWARE | R | MongoDB | SQLServer | Python | Ruby | C | Docker | Azure | Git.

20.5.2020

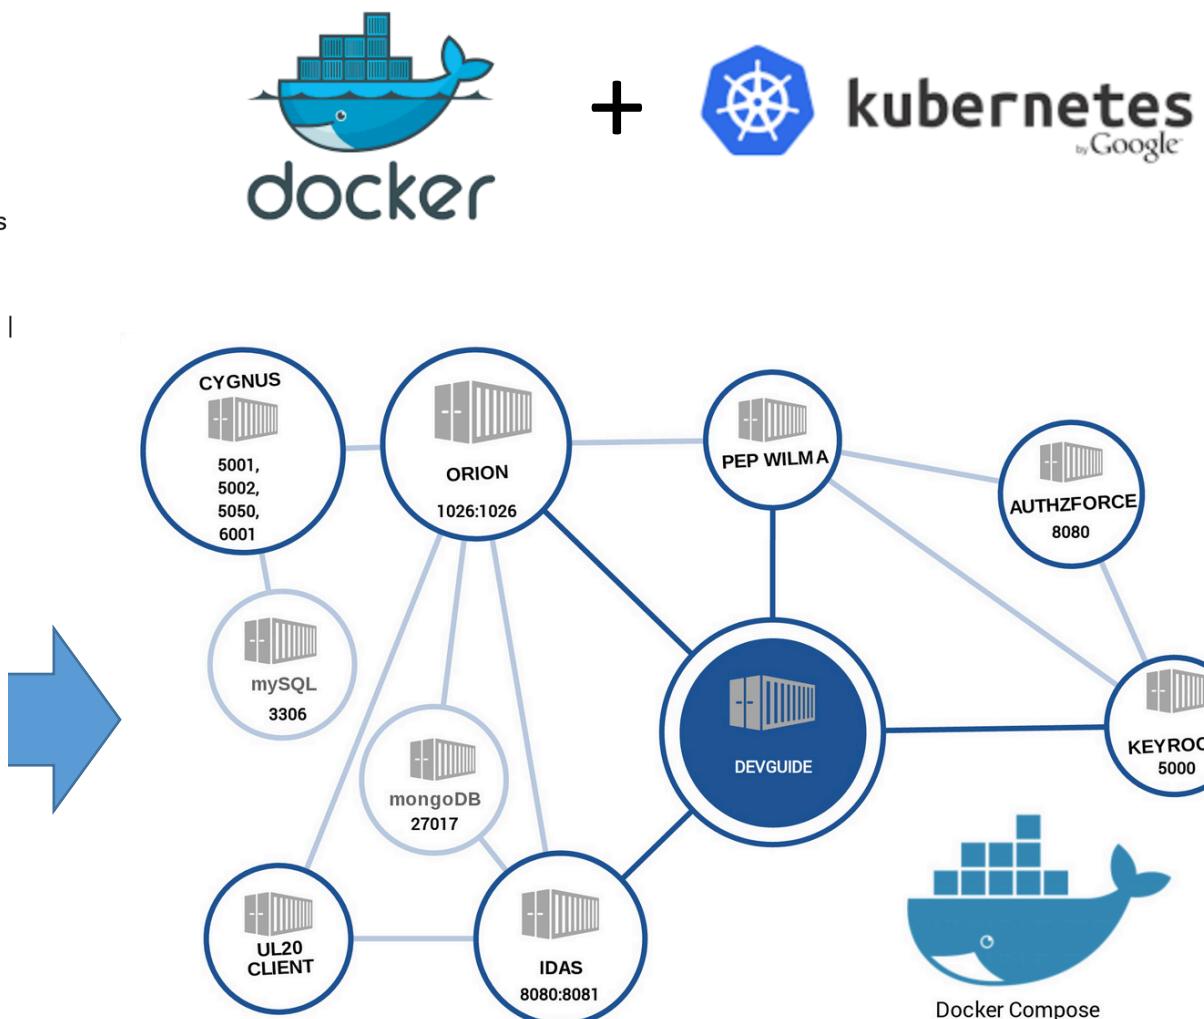

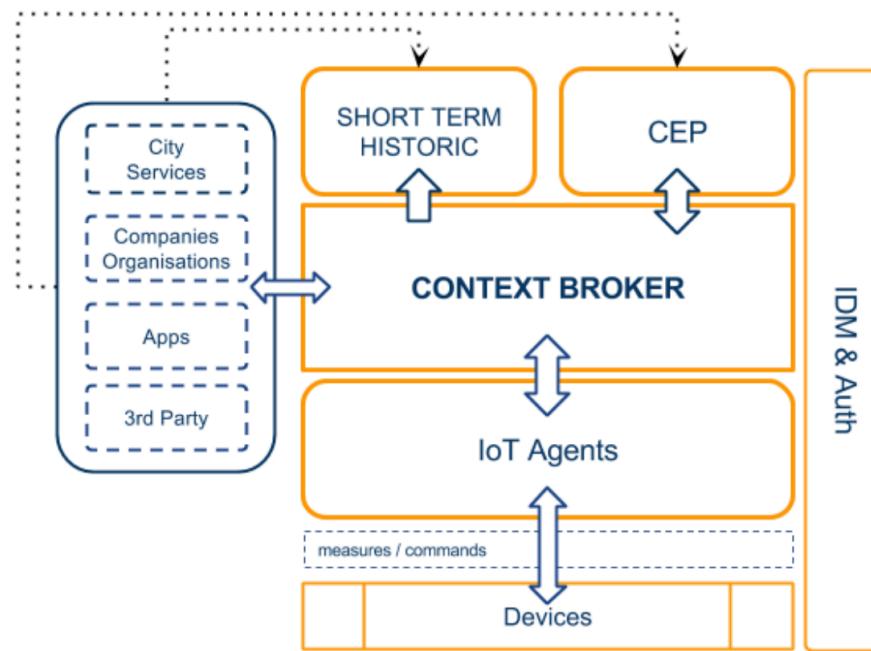

# Start-ups

## Development & Project Manager - Sporadically CTO

INSYLO TECHNOLOGIES SL  
May 2015 – Present · 5 yrs 1 mo  
Barcelona Area, Spain

- To get a product out the door
- Deliver results to the market
- To make sure the development team is able to work as efficiently as possible and this means making sure they have clear goals
- From the initial project scope to deploying the product out to customer sites.
- And develop Android SDK | Golang | FIWARE | R | MongoDB | SQLServer | Python | Ruby | C | Docker | Azure | Git.

# Objectius del curs

- Conèixer les principals característiques i funcionalitats de Docker
  - Autogestió dels contenidors.
  - Fiabilitat.
  - Aplicacions lliures de les dependències instal·lades al sistema amfitrió.
  - Capacitat per desplegar multitud de contenidors en un mateix equip físic.
  - Posada en marxa dels serveis amb major rapidesa.
  - Contenidors molt lleugers que faciliten el seu emmagatzematge, transport i desplegament.
  - Capacitat per executar una àmplia gamma d'aplicacions.
  - Compatibilitat Multi-Sistema (podrem desplegar els nostres contenidors en multitud de plataformes).
  - L'aplicació base de Docker gestionarà els recursos existents per assignar-responsablement entre els contenidors desplegats.
  - Podrem establir una base des de la qual començar els nostres projectes, el que ens estalviarà el temps de preparar l'entorn per a cada un d'ells.
  - Podrem compartir els nostres contenidors per augmentar els repositoris de Docker així com beneficiar-nos dels que comparteixin els altres.

- **Sessió 1**

- Docker
- BalenaOS
- Definició de serveis a través de Docker
- Deploy de serveis a través de BalenaOS

- **Sessió 2**

- Fonaments de Bases de Dades
- Classificació de BBDD

- **Activitat**

- Deploy d'un servei MQTT i un servei gateway contra una BBDD MongoDB
- Deploy de un servei al dispositiu de la RaspPi, disseny/definició del GPIO per ús del servei i reporting de dades a la BBDD MongoDB

# Containers

# Què son els containers?

- Abans dels standards dels containers

# Què son els containers?

- I es van inventar els containers...

Al 1956 la majoria de vaixells eren carregats i descarregats a mà amb un cost de **\$5.86** la tona.

**Malcom McLean** va neixer al 1913 i va desenvolupar el sistema de container intermodal, que va revolucionar el transport internacional.

El seu principi deia que “*Un vaixell només guanya diners quan està navegant*”

Utilitzant containers, els seus costs eren de **16 centims la tona**. La containerització va estandarditzar els processos de càrrega, reduint dràsticament el temps i el cost aplicat.

A més, de dotar de fiabilitat al sistema.

[https://en.wikipedia.org/wiki/Malcom\\_McLean](https://en.wikipedia.org/wiki/Malcom_McLean)

# Què son els containers?

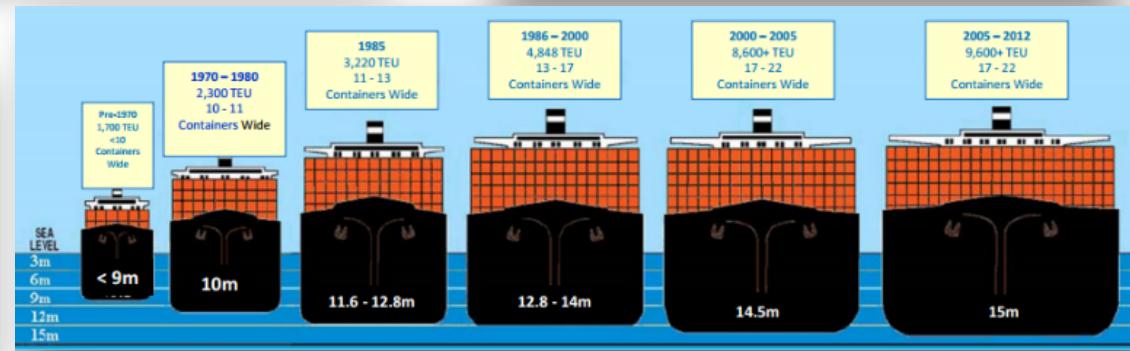

- Omplir el container

# Què son els containers?

- Allotjat el container

docker

# Característiques de Docker

- Light-Weight
  - Mínima emprempta (*cpu/io/network*)
  - Basats en containers linux
  - Utilitza un sistema de fitxers multicapaper aprofitar espai (AUFS/LVM/OverlayFS)
  - Utilitza una estratègia copy-on-write per fer seguiment de canvis

- Portable
  - Pot funcionar en qualsevol Linux que doni suport a LXC.
  - La release 0.7 inclou suport per les distros RedHat/Fedora.
  - Raspberry pi support.
  - Planificades altres eines de distribució (Imctfy, etc.)
  - Planificats suports per altres sistemes operatius (Solaris, OSX, Windows)

- Autocontingut
  - Un contaoner Docker conté tot lo necessari per funcionar
  - És una base mínima del SO
  - Llibreries i frameworks
  - Codi d'aplicació
  - Un container docker ha de ser capaç de funcionar a qualsevol lloc on Docker pugui.

## 1979: Unix V7

Note to reader, yes, I was less than 10 years old at the time. During the development of Unix V7 in 1979, the `chroot` system call was introduced, changing the root directory of a process and its children to a new location in the filesystem. This advance was the beginning process isolation: segregating file access for each process. `Chroot` was added to `BSD` in 1982.

## 2000: FreeBSD Jails

Flash-forward nearly two decades later to 2000, when a small shared-environment hosting provider came up with FreeBSD jails to achieve clear-cut separation between its services and those of its customers for security and ease of administration. FreeBSD Jails allows administrators to partition a FreeBSD computer system into several independent, smaller systems – called “jails” – with the ability to assign an IP address for each system and configuration.

<http://blog.aquasec.com/a-brief-history-of-containers-from-1970s-chroot-to-docker-2016>

# Historia

19 / 9: UNIX v /

## 2001: Linux vServer

Like FreeBSD Jails, [Linux VServer](#) is a jail mechanism that can partition resources (file systems, network addresses, memory) on a computer system. Introduced in 2001, this operating system virtualization that is implemented by patching the Linux kernel. Experimental patches are still available, but the last stable patch was released in 2006

## 2004: Oracle Solaris Containers

2004 Oracle released a [Solaris Container](#) that combines system resource controls and boundary separation provided by zones, which were able to leverage features like snapshots and cloning from ZFS.

## 2005: OpenVZ (Open Virtuzzo)

This is an operating system-level virtualization technology for Linux which uses a patched Linux kernel for virtualization, isolation, resource management and checkpointing. The code was not released as part of the official Linux kernel.

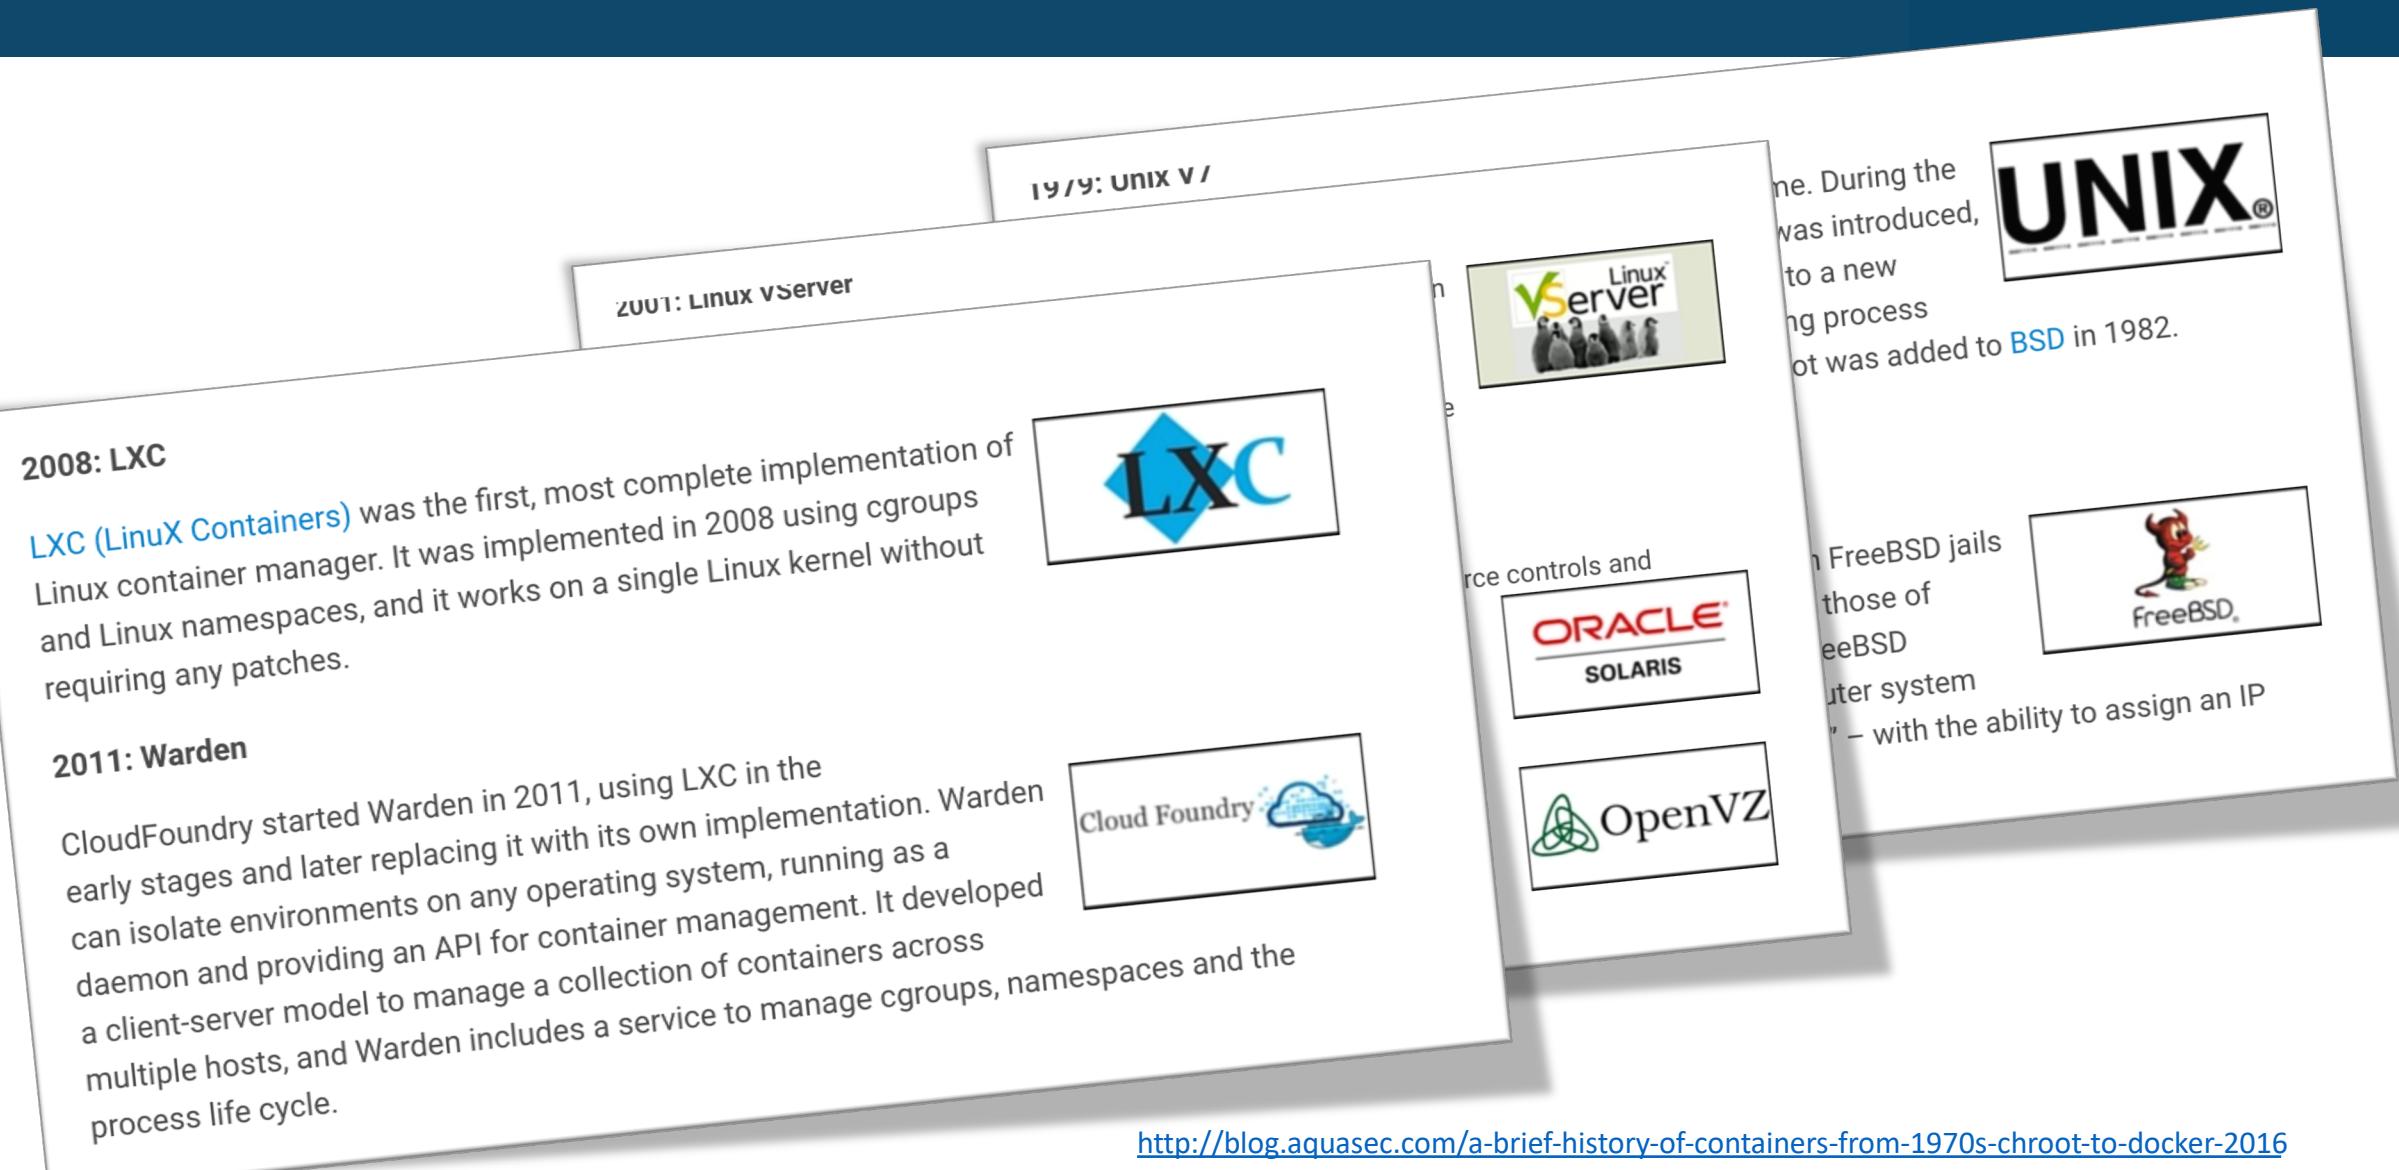

ne. During the was introduced, to a new ing process ot was added to [BSD](#) in 1982.

In FreeBSD jails those of FreeBSD outer system " – with the ability to assign an IP

# Historia

<http://blog.aquasec.com/a-brief-history-of-containers-from-1970s-chroot-to-docker-2016>

## 2013: Docker and the Future

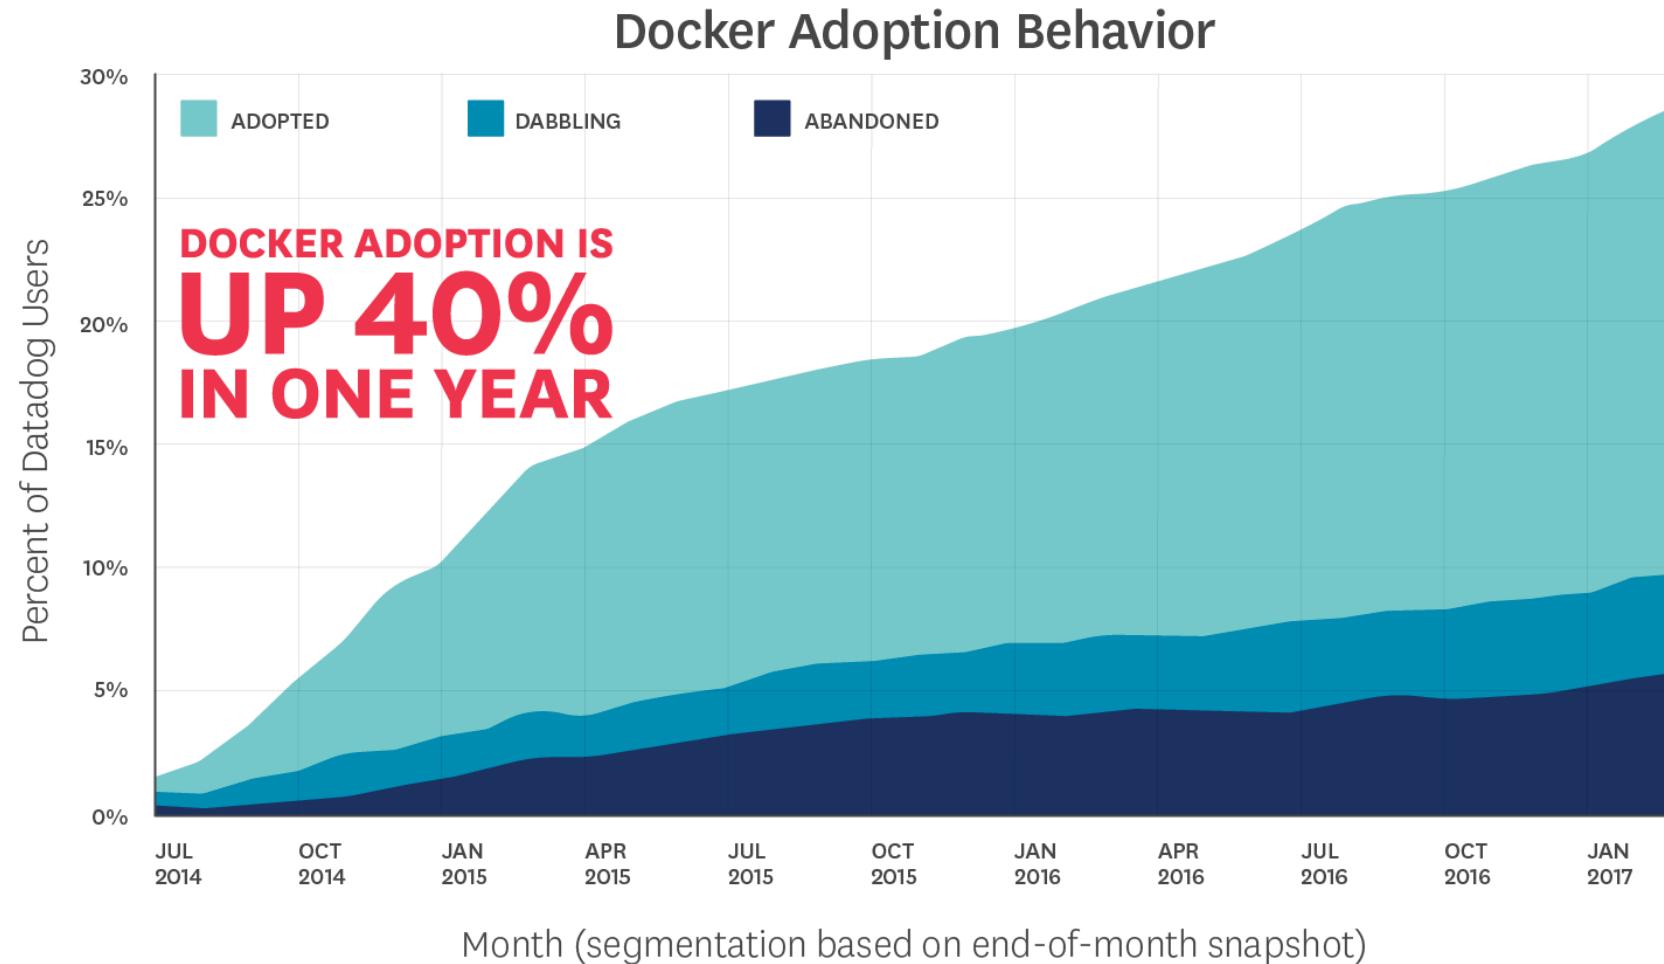

That's my (not so brief) summation of the pre-Docker container landscape. All those iterations had their adopters and devotees, but when Docker emerged in 2013, containers exploded in popularity. It's no coincidence the growth of Docker and container use goes hand-in-hand.

Just as Warden did, Docker also used LXC in its initial stages and later replaced that container manager with its own library, libcontainer. But I've no doubt that Docker separated itself from the pack by offering an entire ecosystem for container management.

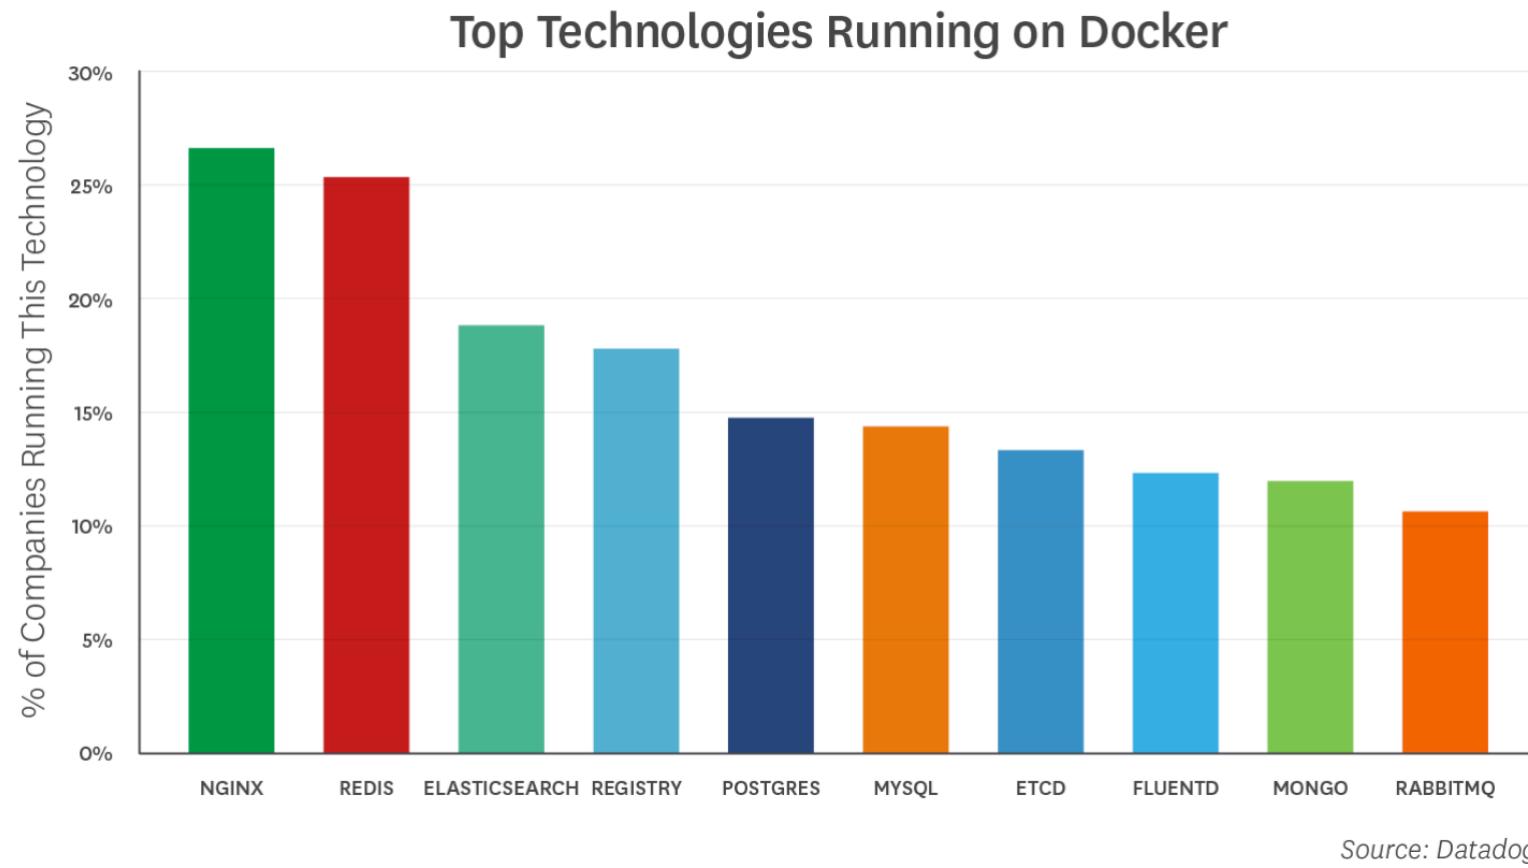

With Docker, developers can create and run application containers quickly. And with the release of Docker Hub, developers can download and run application containers even faster.

<http://blog.aquasec.com/a-brief-history-of-containers-from-1970s-chroot-to-docker-2016>

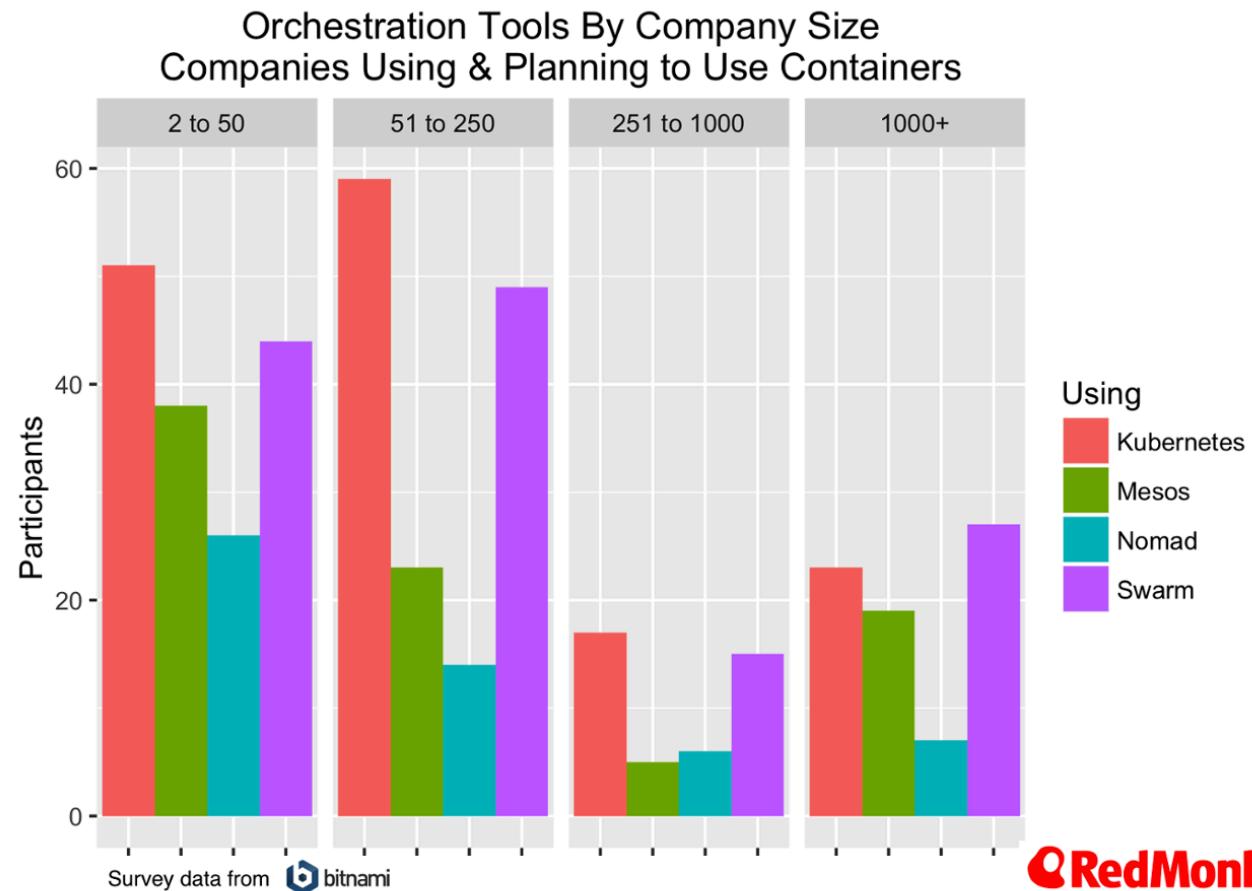

# Utilització de docker

# Utilització de docker

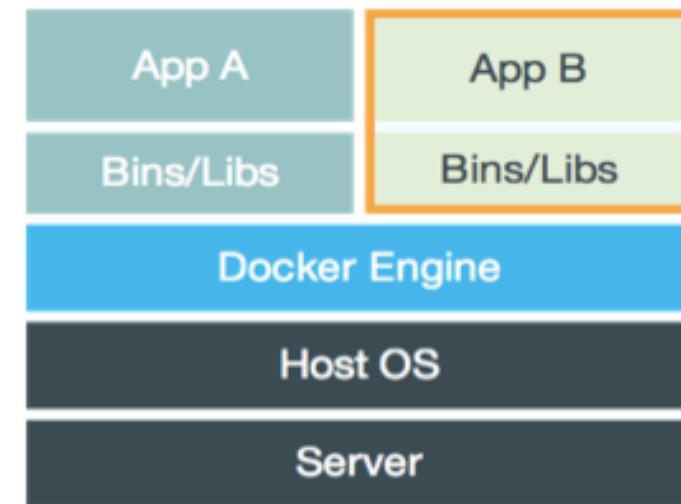

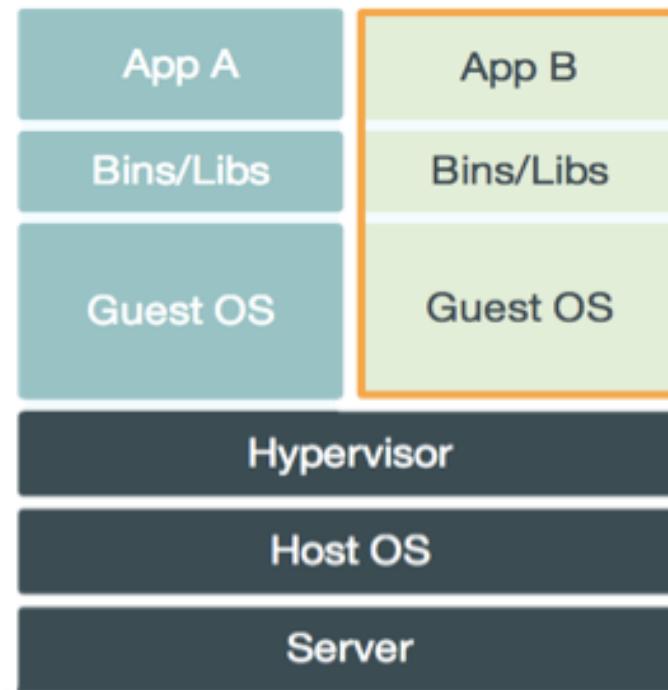

# Utilització de docker

# Docker vs Virtual Machines

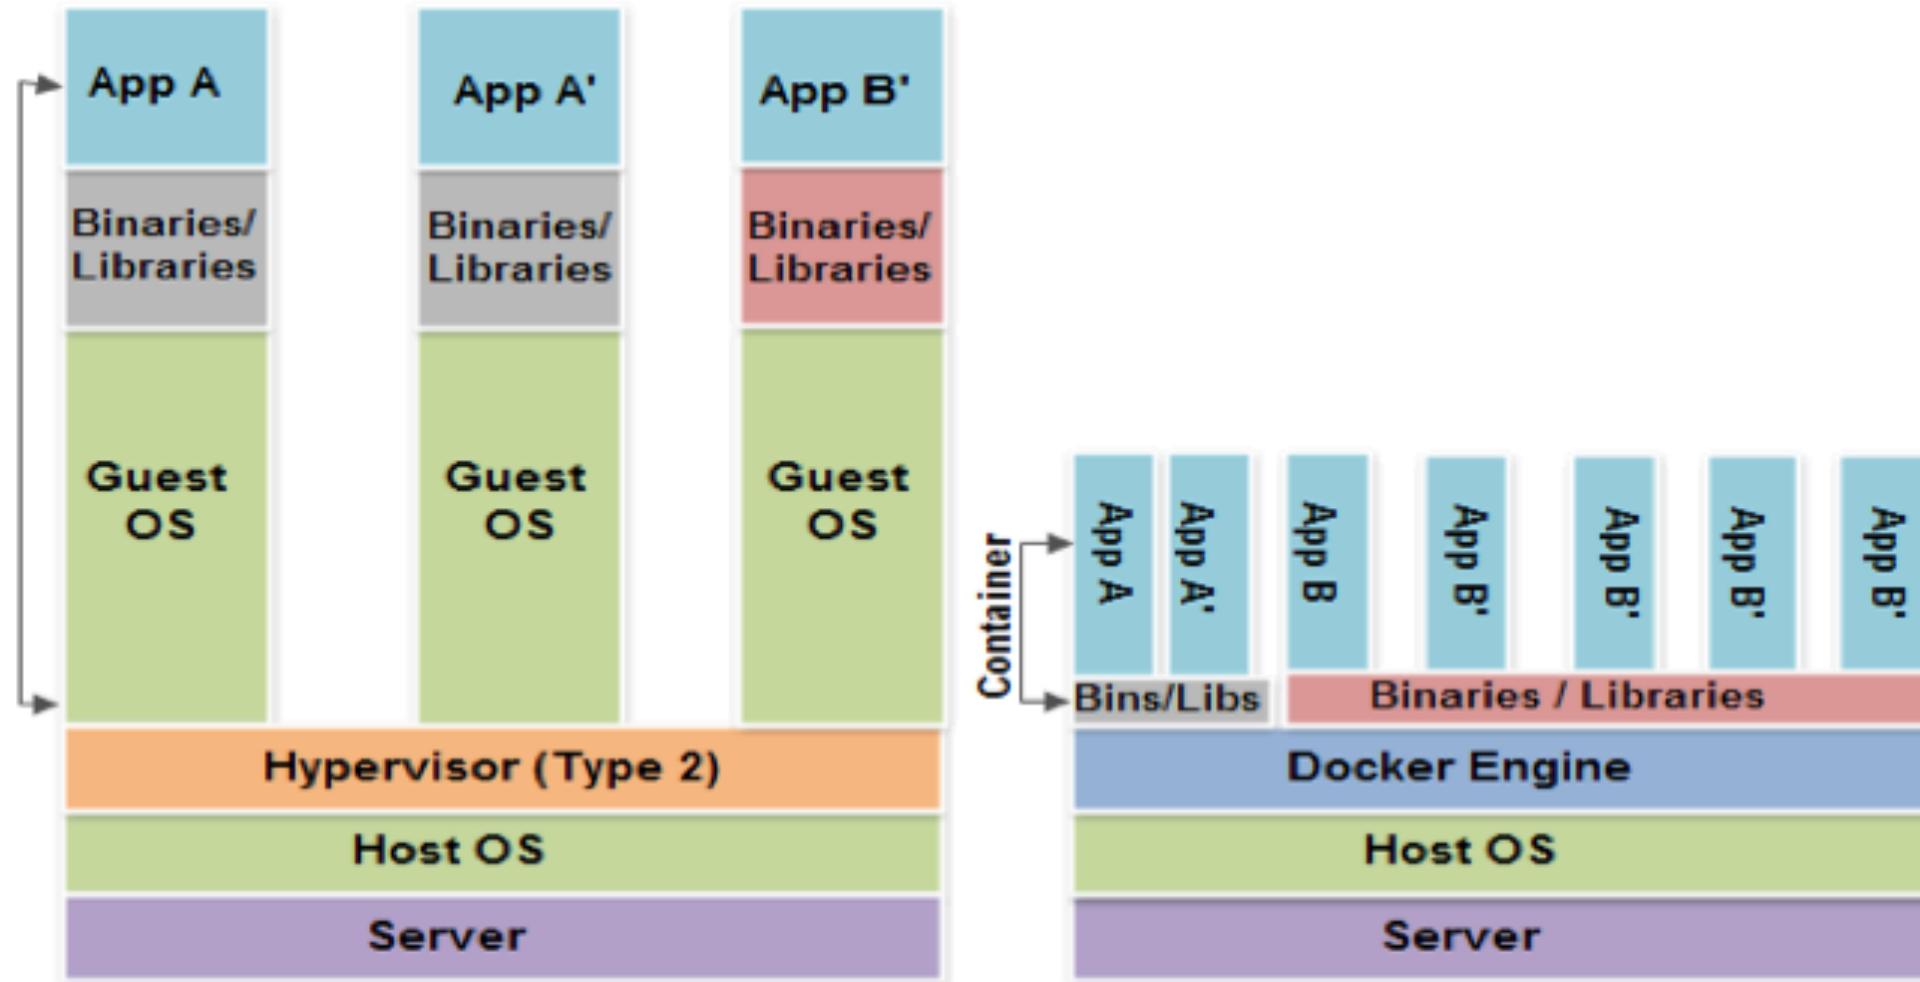

- VM's
  - Instància completa del sistema Operatiu
  - No és fàcil la multi-instància
- Containers
  - Porcions del SO + components
  - Fàcil de duplicar, iniciar i aturar
  - OS Lleuger (Tiny Core Linux & Windows Server Core)

# Docker vs Virtual Machines

## Containers vs Virtual Machines

# Com de petits son els containers?

- ~24MB de descarrega
- S'executa complet a RAM
- Requirements mínims:
  - 46MB RAM
  - i486DX CPU (50MHz, 8KB cache)
- Requirements recomanats:
  - 128MB+ RAM
  - Pentium 2 CPU
- Ho tenim corrent amb una raspberry

# Requeriments de host

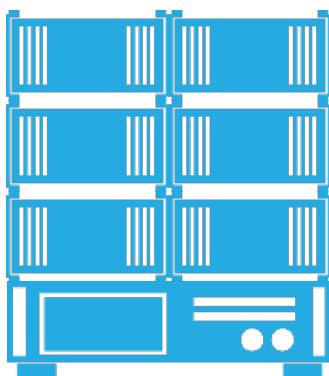

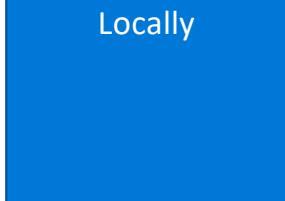

- Requirements mínims:
  - 256-512MB of RAM
  - 1GHz (x86) or 1.4Ghz (x64)CPU
- Recomanats
  - 512MB+
  - 2GHz+ CPU

# On els podem posar?

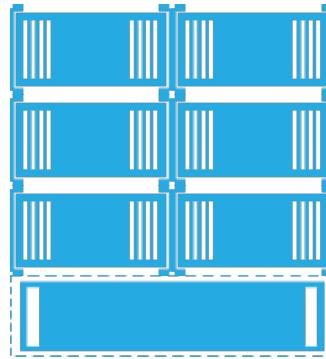

Locally with:

- Docker Toolbox (Linux)
- Hyper V (Windows)

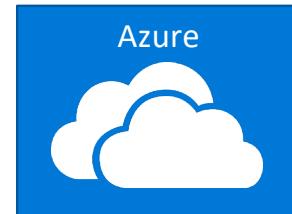

Physical Servers

- Linux (Linux)
- Windows 2016 TP3 (Windows)

## Clouds

- Azure (Linux & Windows)
- Digital Ocean (Linux)
- AWS (Linux)
- Google (Linux)
- Rackspace (Linux)
- ...etc.

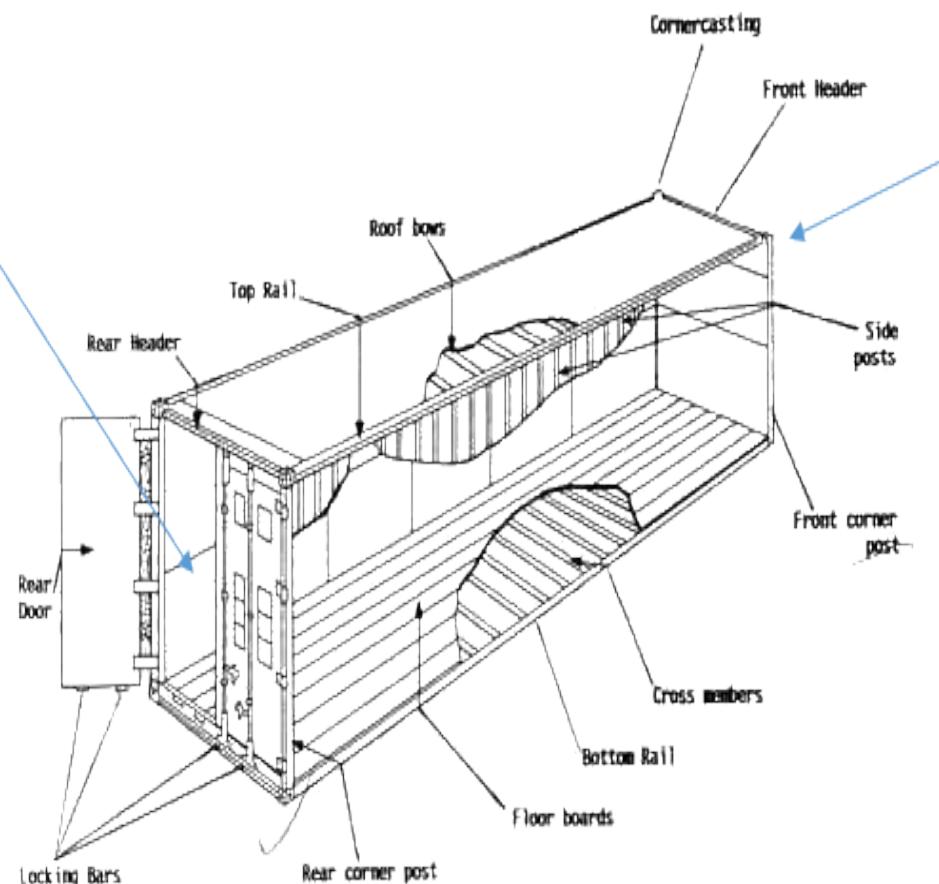

# Què en treiem de bo?

## Dan the Developer

- Worries about what's "inside" the container
  - His code
  - His Libraries
  - His Package Manager
  - His Apps
  - His Data
- All Linux servers look the same

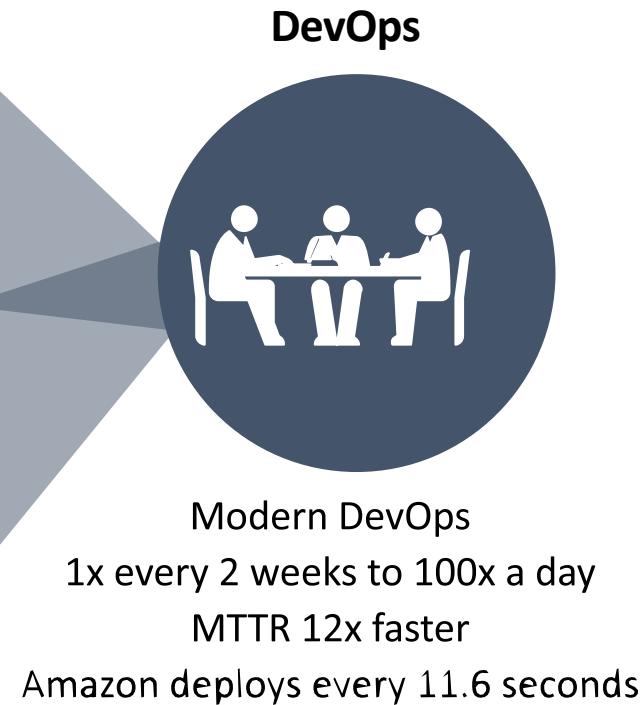

Major components of the container:

## Oscar the Ops Guy

- Worries about what's "outside" the container
  - Logging
  - Remote access
  - Monitoring
  - Network config
- All containers start, stop, copy, attach, migrate, etc. the same way

# Què en treiem de bo?

# Què en treiem de bo?

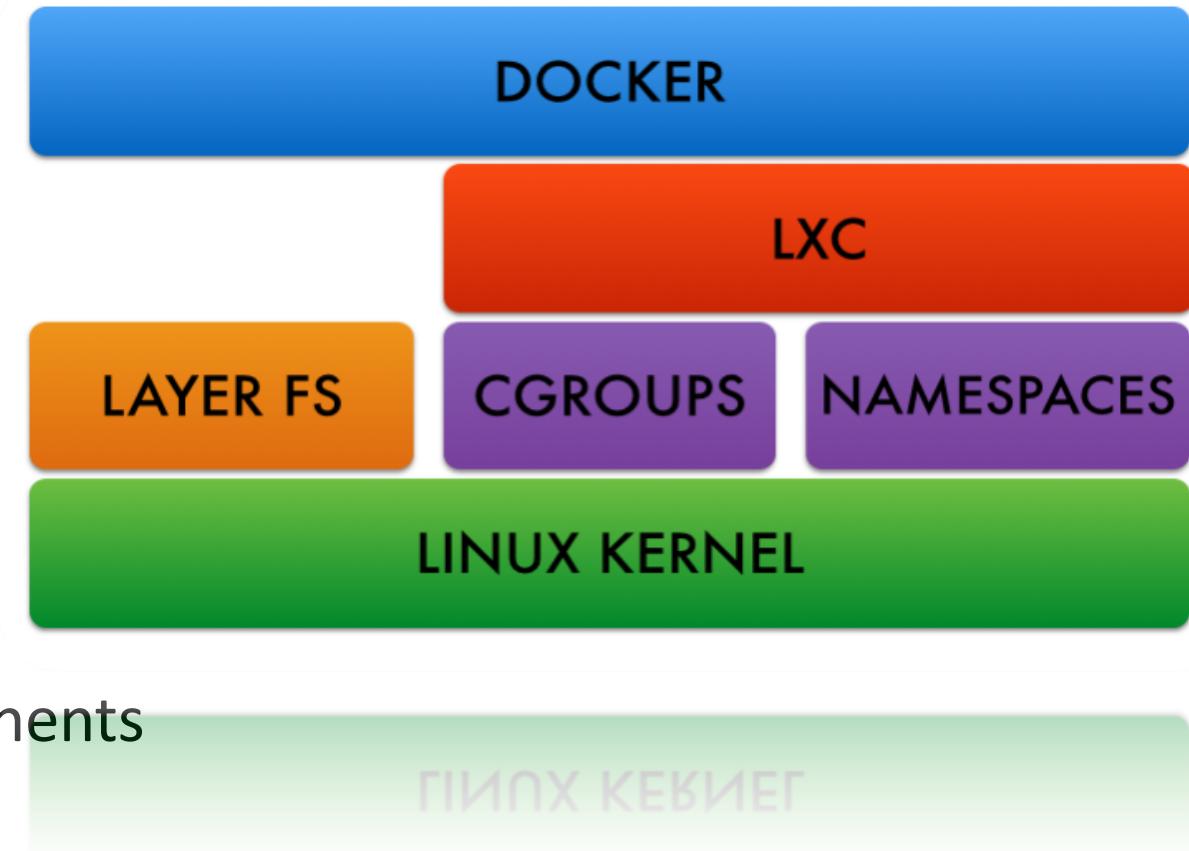

- La infraestructura es converteix en inmutable
- Inici ràpid
- Portable & lleuger
- Tenim una unitat de deploy
- Fàcil creació
- Cada container por ser una porció de la gran aplicació
  - Podem tenir múltiples containers que serveixes a més d'una aplicació (microserveis)

# Terminologia

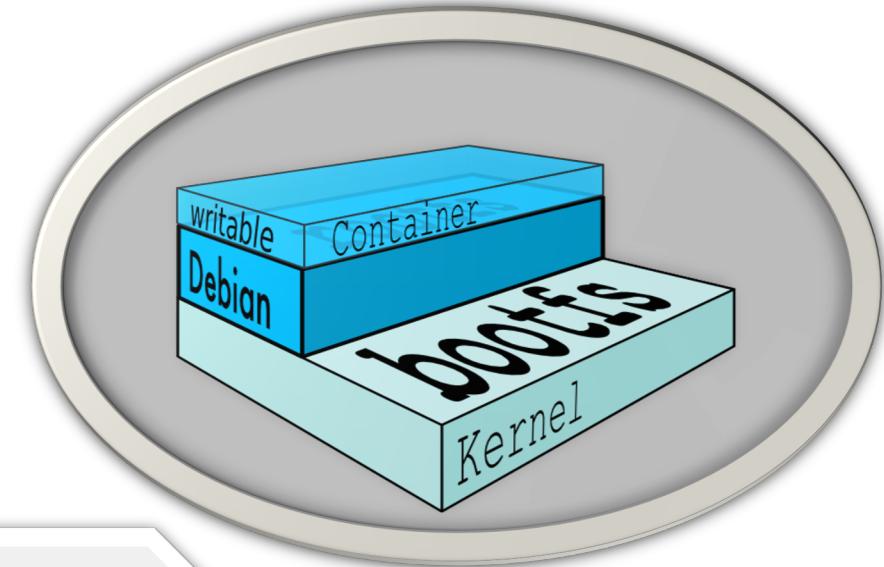

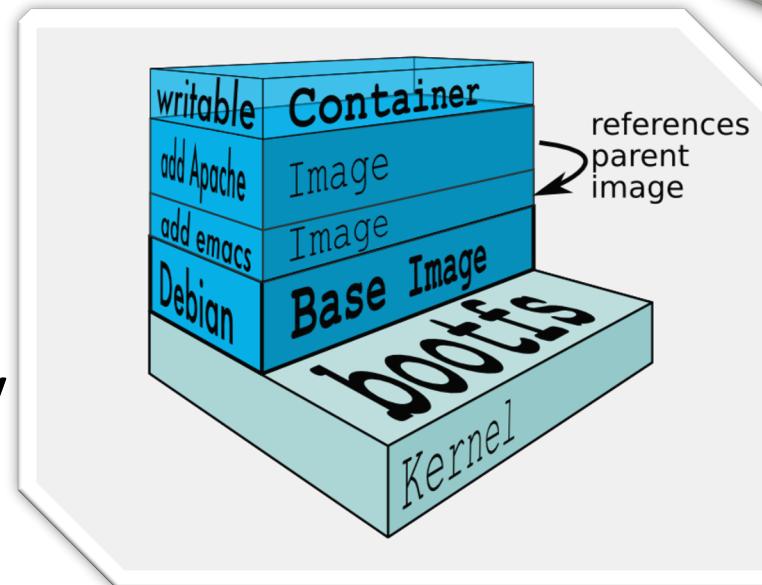

- Docker Engine
  - CLI
  - Docker Daemon
  - Docker Registry
- Docker Hub
  - Cloud service
    - Compartir Aplicaciones
    - Automatitzar workflows
    - Composar apps a partir de components
- Docker images
- Docker containers

# Docker images

- No es un VHD
- No es un FILESYSTEM
- Fa ús de *Union File System*
- És read-only *Layer*
- No té estat
- Basicament un fitxer tar
- Té jerarquia
  - de profunditat arbitrària
- Pot encabir-se al Docker Registry

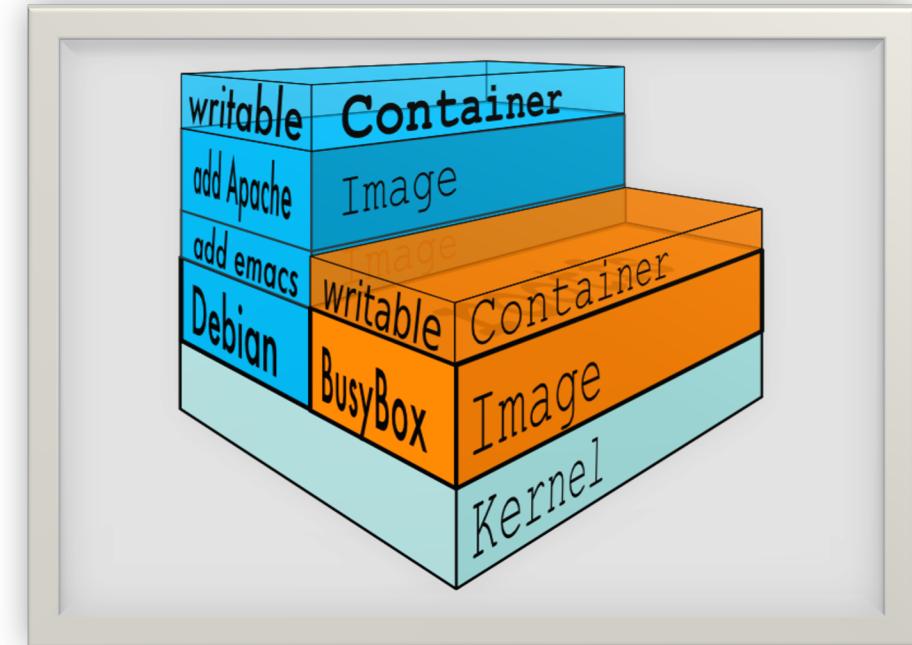

# Docker container

És la unitat bàsica d'entrega de software (ship it!)

- S'executa a tot arreu
  - independentment de la versió de kernel
  - o de la distro del host
  - \* però han de coincidir amb arquitectura (x32, x64, etc)
- Ho executa tot
  - si pot correr a un host, ho pot fer dins d'un container

\*A menys que es facin servir emuladors de CPU amb **qemu** i **binfmt**

\$ docker images	# mostra tots els images.
\$ docker import	# crea una imatge des d'un arxiu tar.
\$ docker build	# crea una imatge de d'un Dockerfile.
\$ docker commit	# crea una image des de un container.
\$ docker rmi	# elimina una image.
\$ docker history	# llista els canvis d'una imatge.

# Cicle de vida d'un container

La vida d'un container...

- Concepció
  - **BUILD** una imatge a partir d'un Dockerfile
- Neixement
  - **RUN** (create+start) un container
- Reprocció
  - **COMMIT** (persisteix) un container a una imatge
  - **RUN** un nou container des d'una imatge
- Sleep
  - **KILL** un container en execució
- Wake
  - **START** un container aturat
- Death
  - **RM** (delete) un container aturat
- Extinció
  - **RMI** una imatge de container (delete image)

# Dockerfile

- Conceptualment és un Makefile
- Extend una imatge base
- Que es converteix en una nova imatge
- Imperatiu, no Declaratiu

Defineix la recepta per construir una imatge

- S'utilitza docker build per executar un dokerfile
- Es poden definir ordres per defecte per executar, definir ports exposats, etc.

```
# our base image
FROM alpine:latest

# Install python and pip
RUN apk add --update py-pip

# upgrade pip
RUN pip install --upgrade pip

# install Python modules needed by the Python app
COPY requirements.txt /usr/src/app/
RUN pip install --no-cache-dir -r /usr/src/app/requirements.txt

# copy files required for the app to run
COPY app.py /usr/src/app/
COPY templates/index.html /usr/src/app/templates/

# tell the port number the container should expose
EXPOSE 5000

# run the application
CMD ["python", "/usr/src/app/app.py"]
```

Macbook:flask-app draba\$ cat Dockerfile

```
# our base image
FROM alpine:latest

# Install python and pip
RUN apk add --update py-pip

# upgrade pip
RUN pip install --upgrade pip

# install Python modules needed by the Python app
COPY requirements.txt /usr/src/app/
RUN pip install --no-cache-dir -r /usr/src/app/requirements.txt
```

# Dockerfile: docker-run-vs-cmd-vs-entrypoint

## In a nutshell

- RUN executes command(s) in a new layer and creates a new image.  
E.g., it is often used for installing software packages.
- CMD sets default command and/or parameters, which can be overwritten from command line when docker container runs.
- ENTRYPOINT configures a container that will run as an executable.

```
RUN apt-get install python3
CMD echo "Hello world"
ENTRYPOINT echo "Hello world"
```

When instruction is executed in *shell* form it calls `/bin/sh -c <command>` under the hood and normal shell processing happens. For example, the following snippet in Dockerfile

```
ENV name John Dow
ENTRYPOINT echo "Hello, $name"
```

when container runs as `docker run -it <image>` will produce output

```
Hello, John Dow
```

<https://goinbigdata.com/docker-run-vs-cmd-vs-entrypoint/>

# Preguntes típiques

# 5 preguntas típicas sobre Docker

## 1. Docker client versus host

- Docker client is a command line interface (CLI) Docker
- Docker host is a Linux/Windows VM running Docker daemon

## 2. Docker Linux and Windows hosts

- You can only create the same container as the underlying host VM - Linux host = Linux containers

## 3. Docker Image vs Docker Container

- Image = The definition – literally a single file [My Website]
- Container – An instance of an image [3 instances of My Website]

## 4. Cloud Registry Service and Public Image Repos

- Unlimited public repos, one free private or buy private repos
- 50,000+ images - Wordpress, Nginx, Redis, MySQL, Logstash, and your images!
- Docker Trusted Registry – Dedicated registry application deployable on-premise or direct from Azure Marketplace

# 5 preguntas típicas sobre Docker

## 5. Deployments **replace** instead of **update**

***“Immutable infrastructure”***

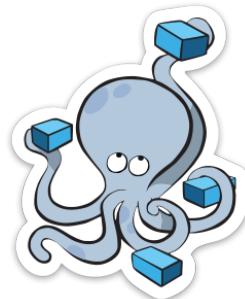

### **Website**

**Update** your app using  
Web Deploy or CI/CD

### **Docker**

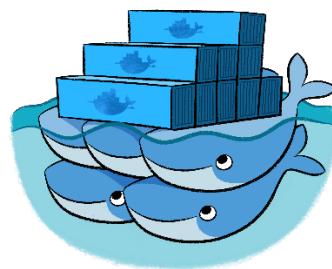

**Replace** running  
containers using CI,  
Don't update the old  
container

# Altres conceptes Docker

## Compose

Definir i fer deploy d'aplicacions multicontainer

## Swarm

Ús de multiples màquines com a una de sola, per controlar multiples entorns de containers.

## Docker Machine

Crear i gestionar instàncies Docker localment i en cloud

# Run Docker containers on embedded devices

A host OS tailored for containers, designed for reliability,  
proven in production.

Try balenaOS

**Projecte:** Servei MQTT connectat amb una base de dades Mongo, per historificar tots els missatges enviats per MQTT

## 1) Crear una compta a BalenaCloud

The screenshot shows the balenaCloud interface. At the top, there's a navigation bar with links for 'Getting Started', 'Docs', 'Forums', and 'Status'. Below that is a 'Beginner's Help' section. The main area is titled 'Applications' and shows a single application named 'mqtt-gateway'. This application is labeled as 'Starter' and has 1 device connected. A green progress bar indicates 100% completion. Below the progress bar is a legend for device status: Online (green), Config (orange), Updating (blue), Offline (red), Post prov (purple), and Inactive (grey). At the bottom of the application card, it shows the release '31df7b6', architecture 'arch64', and app ID '1665004'.

## 2) Seguirem les passes...

✓ Create application → ✓ Add device → ✓ Add release → ✓ Add member → What's next?

# Setup BalenaOS :: Crear la Aplicació

# Setup BalenaOS :: Afegir dispositius

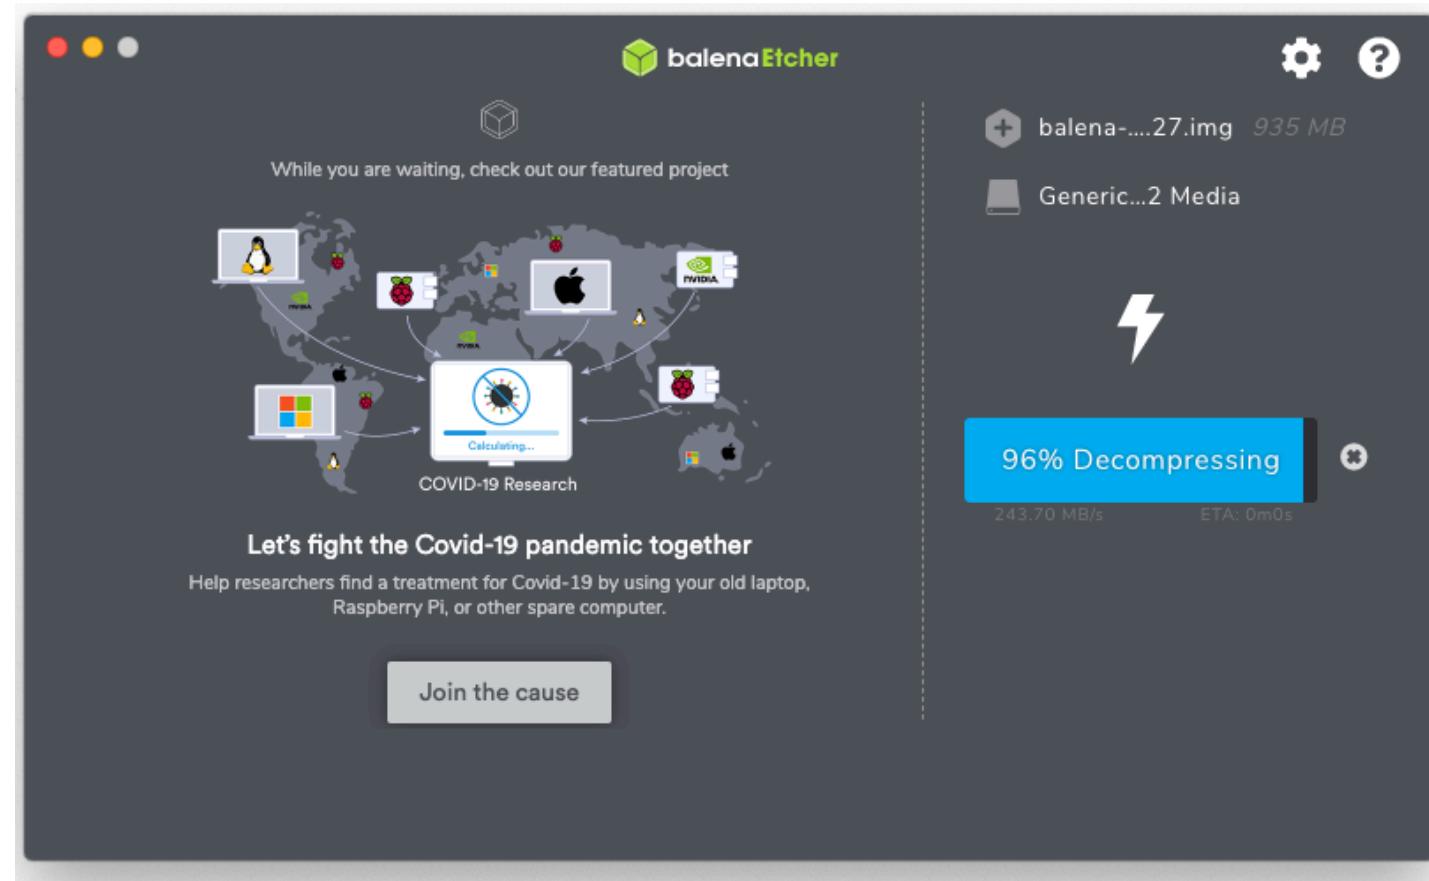

<https://www.balena.io/docs/learn/getting-started/raspberry3/python/>

A screenshot of the balenaCloud web interface. The top navigation bar includes links for 'Getting Started', 'Docs', 'Forums', and 'Status'. On the left, a sidebar menu has 'Devices' selected, indicated by a dark blue background. Other options include 'Fleet Configuration', 'Environment Variables', and 'Service Variables'. The main content area shows the 'mqtt-gateway' application under 'Applications'. A message says 'You don't have any devices yet. How about adding one?' with a dashed arrow pointing to the '+ Add device' button. There are also 'Add filter' and 'Search entries...' buttons. The top right features a 'Create application' button with a checkmark icon.

# Setup BalenaOS :: Cremar la SD

<https://www.balena.io/docs/learn/getting-started/raspberrypi3/python/>

# Setup BalenaOS :: Afegir release de codi

<https://www.balena.io/docs/learn/getting-started/raspberry3/python/>

The screenshot shows the balenaCloud web interface. On the left, a sidebar menu includes: Home, Devices (selected), Fleet Configuration, Environment Variables, Service Variables, and Releases (with a note: "20.5.2020"). The main content area shows a list of devices under the "Applications > mqtt-gateway" section. One device, "patient-field", is listed with status "Online", last seen "Online (for a few seconds)", UUID "a05984e", and OS Version "Unknown". A modal window is open on the right, titled "Add release", with a message: "You don't have any releases yet. How about adding one?". The top navigation bar includes links for Getting Started, Docs, Forums, and Status.

# Setup BalenaOS :: Git clone del projecte

```
git clone https://github.com/davidraba/edu-masteriot-fleet-management.git
```

From bash:

```
$ balena login  
$ balena push mqtt-gateway --source ./
```

The screenshot shows the Balena Cloud UI for the 'patient-field' application. It displays the 'Device Service Variables' section. A table lists two variables: 'HOSTDB' (Service: gateway, Name: gateway) and 'PORTDB' (Service: gateway, Name: gateway). A 'Add variable' button is visible at the top left of the table area.

Service	Name
gateway	HOSTDB
gateway	PORTDB

20.5.2020

# Setup BalenaOS :: Simularem un missatge MQTT

http://mqtt-explorer.com/

The screenshot shows the balenaCloud interface on the left and the MQTT Explorer application on the right.

**balenaCloud Interface (Left):**

- Summary:** Shows the device is online (status: Online, UUID: a05984e).
- Device Configuration:** Shows the device type is a Raspberry Pi 3 (using 64bit).
- Device Variables:** Shows the current release is 425ac83 and the target release is 425ac83.
- Device Service Variables:** Shows the public device URL is 192.168.0.29.
- Location:** Shows no tags configured yet.
- Actions:** Shows the device is running.
- Diagnostics:** Shows experimental services: gateway (Running) and mqtt (Running).

**MQTT Explorer (Right):**

- Device Status:** IP address 192.168.0.29, \$SYS topics (46 topics, 653 messages), sensors = ('humidity':40.3), actuators = ('light':1).
- Value:** Comparison of two messages:
  - {'humidity':34.3}
  - + {'humidity':40.3}QoS: 0, 19/05/2020 14:18:36. Comparing with selected message: + 1 line, - 1 line.
- History:** Shows history entries:
  - 19/05/2020 14:18:36: {'humidity':40.3}
  - 19/05/2020 14:18:20 (-15.87 seconds): {'humidity':34.3}
- Publish:** Topic: actuators, JSON message: {"light":1}, Publish button.

# Setup BalenaOS :: Revisem la BBDD

Robo 3T

The screenshot shows the Robo 3T application interface. On the left, there is a sidebar with a tree view of databases and collections. The 'Master IoT' database is selected, showing its collections: System, covid19, MasterIoT, Collections (1), Functions, and Users. The 'Collections (1)' node is expanded, and 'sensors' is selected. The main panel displays the results of the query `db.getCollection('sensors').find({})`. The results are listed in a table with columns: Key, Value, and Type. The table shows three documents from the 'sensors' collection.

Key	Type
1 ObjectId("5ec3ce8c415a98576b19...") { 6 fields }	Object
_id	ObjectId("5ec3ce8c415a98576b197427")
topic	sensors
payload	{'humidity':34.3}
qos	0
timestamp	1589890700
datetime	19/05/2020 12:18:20
2 ObjectId("5ec3ce9c415a98576b19...") { 6 fields }	Object
_id	ObjectId("5ec3ce9c415a98576b197428")
topic	sensors
payload	{'humidity':40.3}
qos	0
timestamp	1589890716
datetime	19/05/2020 12:18:36
3 ObjectId("5ec3cf25415a98576b19...") { 6 fields }	Object
_id	ObjectId("5ec3cf25415a98576b197429")
topic	actuators
payload	{'light':1}
qos	0
timestamp	1589890853
datetime	19/05/2020 12:20:53

# BalenaOS :: Advanced stuff...

## </> Local Mode

Local mode allows you to build and sync code to your device locally for rapid development.

## Multicontainers

Develop an application with multiple containers to provide a more modular approach to application management.

## Configurations

Manage your device fleet with the use of configuration, environment, and service variables

## Get Inspired

Explore our projects to give you an idea of more things you can do with balena.

## How to get help?

If you find yourself stuck or confused, help is just a click away.

## GPIO

```
gpio:  
  build: ./gpio  
  devices:  
    - "/dev/i2c-1:/dev/i2c-1"  
    - "/dev/mem:/dev/mem"  
    - "/dev/ttyACM0:/dev/ttyACM0"  
  cap_add:  
    - SYS_RAWIO
```
